

Ultra Fast timing detectors with applications in cosmic ray physics, medical science and other domains

Christophe Royon
University of Kansas, Lawrence, USA
ANIMMA Conference, Prague, Czech Republic

June 24 2021

- Fast Silicon Detectors
- Signal analysis
- Medical applications
- Cosmic-ray applications in collaboration with NASA

Signal amplification and measurement

- Signal originating from a Si detector: signal duration of a few nanoseconds (fast detector)
- 1st step: Amplify the signal using an amplifier designed at KU using standard components (price: a few 10's of Euros per channel)
- 2nd step: Very fast digitization of the signal: measure many points on the fast increasing signal as an example
- Allows to measure simultaneously time-of-flight, pulse amplitude and shape

Timing measurements at KU: Test stand

Preliminary time measurements currently being performed at KU

Pulsed NIR PiLa

Amplifier with the
CTTPS sensor

- Design of a new multi-purpose electronics board for testing, many different applications, and lower cost compared to commercially available solutions (patent in progress)
- Full test stand installed at the University of Kansas: readout of a Si detector
- Using laser or radioactive source in front of the detector

Test stand at the University of Kansas

- Visualize pixels from Si detectors: Pixel size: ~ 3 mm
- Test timing detectors at Fermilab: Timing resolution per layer of Si detector: ~ 25 ps
- The main idea is to reconstruct the full signal by performing very fast sampling \rightarrow Many applications

Measuring cosmic ray in space: the AGILE project

- We want to measure the type of particles (p , He , Fe , Pb , ...) and at the same time their energies
- Analysis of cosmic ray particles: using a cube sat, cheap to be sent into space
- Use similar technics: measure the signal (Bragg peak) where the particle stops in a Si detector, and use fast sampling
- Allows extracting type/energy of particles: project in collaboration with NASA, to be launched in Spring 2022, <https://arxiv.org/abs/2103.00613>

AGILE: Measuring type and energy of particles (simulation)

AGILE: Measuring type and energy of particles

- Simulation using GEANT (particles), Weightfield (Si detector), LTspice (electronics): Leads to a database of rise time, amplitude
- Rise time vs energy: allows to obtain Particle Id
- Signal amplitude (or integral) gives access to energy

AGILE: Measuring type and energy of particles

- Key plot: Amplitude vs rise time
- Allows identifying different particles (Z) and measure their energy
- Launch in Spring 2022

Measuring radiation is cancer treatment

- Ultra fast silicon detectors and readout system were put in an electron beam used in the past for photon therapy at St Luke Hospital, Dublin, Ireland
- Precise and instantaneous measurements of dose during cancer treatment (especially for flash proton beam treatment)
- develop a fast and efficient detector to count the particles up to a high rate: very precise instantaneous dose measurement, no need of calibration, high granularity (mm^2)

Single particle Id in Dublin hospital

- Use UFSD and their fast signal in order to identify and measure spikes in signal due to particles passing by
- Allows measuring doses almost instantaneously

- Very precise dose measurement allowing to adapt better treatment to patients especially for flash dose treatments (brain cancer for instance)

Tests performed at St Luke hospital, University of Dublin, Ireland

- Measurement of charge deposited in Si detector compared to standard measurement using an ion chamber: good correlation
- Our detectors see in addition the beam structure (periodicity of the beam of ~ 330 ps, contrary to a few seconds for the ion chamber): measure single particles from the beam
- Fundamental to measure instantaneous doses for high intensity proton therapy as example
- For more details: Arxiv 2101.07134, Phys. Med. Biol. 66 (2021) 135002

Another application: understanding catalysis in chemistry/pharmacy

- Better understanding of the liquid-gas or liquid-liquid interfaces and their evolution as a function of time: Measure a snapshot every 50 ps or so
- Understanding catalysis in chemistry
- Many applications: Desalinization of sea water, improve medicine performance by understanding better the interface between the medicine and human cells

Conclusion

- Fast timing detectors originally developed for high energy physics at KU: development of an amplifier using standard components
- 1st application: Measure cosmic ray particles (both type of particles and their energies) in a cube sat in collaboration with NASA using the Bragg peak technique
- 2nd application: Measure doses received by a patient during cancer treatment instantaneously, with high accuracy

Which detectors? Silicon Low Gain Avalanche Detectors

Signal shape is determined by Ramo's Theorem:

- Idea: Measuring radiation using ultra fast silicon detectors
- Large velocity needed, which means fast detector
- Large fields and large pad to have uniform field
- Lots of charge
- We use ultra-fast silicon detectors
